

ACX Token Whitepaper

1. Introduction

ACX is a utility token deployed on BNB Smart Chain (BEP-20). It is designed to provide structured access to digital services, platform features, and ecosystem participation. The token focuses strictly on functional usage rather than speculative purposes.

2. Problem Statement

Digital ecosystems require transparent and standardized access mechanisms. Traditional access systems often lack blockchain-level verification and auditability. ACX addresses this gap by providing a blockchain-based utility access token.

3. Solution

ACX enables on-chain verification of participation and service activation. It integrates with digital platforms to provide secure, structured access to ecosystem tools and services.

4. Token Utility

- Platform access authorization
- Service activation and verification
- Digital ecosystem participation
- On-chain identity linkage

5. Tokenomics

Total Supply: 1,000,000,000 ACX Network: BNB Smart Chain (BEP-20) Minting: Limited and controlled Burn Mechanism: Applicable if required

6. Governance & Contract Transparency

The ACX smart contract source code is publicly verified on BscScan. Governance follows transparent and controlled administrative practices. The contract address is publicly available for verification.

7. Disclaimer

ACX is a utility token intended solely for digital access and ecosystem participation. It does not constitute securities, investment contracts, or financial instruments. Users should conduct independent research before interacting with blockchain assets.
